

Orders Table Documentation

March 11, 2020

orderID

- Contains the unique ID for the order to be tracked throughout the database and food prep process

tableID

- Contains the unique table ID number so the food can be associated to a certain table

orderTime

- Contains the time the order was submitted to the kitchen

Status

- A boolean flag that tells whether the order has been fully completed by the kitchen or is still being made

chargeAmount

- Contains the total dollar amount charged to the customer's account

restaurantID

- Contains the unique restaurant ID number that associates the order to the restaurant it was made/taken in

customerName

- Contains the name of the customer that is associated to the order and the account making the order

alexaStatus

- Contains whether the order was placed on an Alexa or not. This will help to limit the number of orders placed on a single Alexa at a single table to one.
